nexchat sql

Let me read all the current backend files first before converting.Good, I have the full picture. Now let me install Sequelize and build the SQL conversion:Good. Now write the SQL database module with Sequelize:Now write the full SQL server index:Here's **nexchat-sql.zip** — the full SQL backend. Here's exactly what changed and how it works:

What replaced what

MongoDB / Mongoose	SQL / Sequelize
`mongoose.connect()`	`sequelize.authenticate()` + `sequelize.sync()`
`mongoose.Schema`	`sequelize.define()` with `DataTypes`
`pre('save')` hook	`beforeCreate` / `beforeUpdate` hooks
`Room.findOne({ $or: [...] })`	`Room.findAll({ where: { [Op.or]: [...] } })`
`members: [String]` array on Room	Separate `RoomMember` join table
`reactions: Map<emoji, String[]>` on Message	Separate `Reaction` table with unique constraint
`doc.toObject()`	`instance.get({ plain: true })`
ObjectId `_id`	UUID `id` (aliased as `_id` for frontend compatibility)
`User.countDocuments()`	`User.count()`

Three dialects — one `.env` switch

```
# SQLite (zero config, local file)
DB_DIALECT=sqlite
SQLITE_PATH=./nexchat.db

# PostgreSQL (Render, Neon, Supabase)
DB_DIALECT=postgres
DATABASE_URL=postgres://user:pass@host:5432/dbname
DB_SSL=true

# MySQL (PlanetScale, Railway)
```

```
DB_DIALECT=mysql
DATABASE_URL=mysql://user:pass@host:3306/dbname
```

Quick start

```
unzip nexchat-sql.zip && cd nexchat-sql
npm install

# SQLite — needs the driver
npm install sqlite3      # or: npm install better-sqlite3

cp .env.example .env     # set DB_DIALECT=sqlite for local dev
npm start
# Tables are auto-created on first run via sequelize.sync({ alter: true })
```

New file — `server/db.js`

This is the only new file. It contains all Sequelize model definitions, associations, hooks, and query helper functions (`findRoomsForUser`, `addMember`, `removeMember`, `findMessages`, `addReaction`) that match the same interface the rest of the server expects. The `server/index.js` calls these helpers and never writes raw SQL — switching dialects only requires changing `DB_DIALECT` in `.env`.
